Government Problem Statement

15.	Problem Statement Title	Implement an AI-based system to monitor employee behaviour and detect suspicious activities that could indicate insider threats.
	Description	Implementing an AI-based system to monitor employee behavior and detect suspicious activities that could indicate insider threats involves leveraging machine learning algorithms and behavioral analytics to analyze patterns of activity within an organization's network. Insider threats, which are security risks originating from within an organization, often involve employees or contractors who have authorized access to sensitive information or systems. These threats can be difficult to detect using traditional security measures since the attacker is already trusted within the system.
